

## EEG patterns in Encephalopathy

Dr.Pasiri Sithinamsuwan

Division of Neurology  
Department of Medicine  
Phramongkutklao Hospital

### Scope

- Diffuse encephalopathy
- EEG in specific encephalopathies
- Encephalitides & degenerative encephalopathies

## EEG in adult patients with Diffuse encephalopathy

### Diffuse encephalopathy

- Common
- Clinical varieties
- Causes
  - Metabolic
  - Septic
  - Toxic
  - Anoxic

## EEG in diffuse encephalopathy

- General concepts
  - Diffuse or generalized abnormalities
  - The most common = slowing (< 8 Hz)
    - Adult: more frontal (anterior)
    - Children: more occipital (posterior)
  - No specific patterns for any etiologies
  - Serial EEG
    - Diagnosis, prognosis and Rx assessment

## EEG patterns in diffuse encephalopathy

- Common pattern
- More severe pattern
- Less common pattern

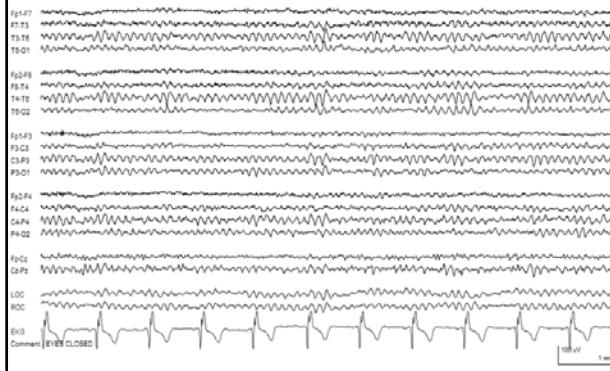

## Common EEG patterns

- Generalized slowing
  - Background slowing
  - Intermittent slowing
  - Continuous slowing

## Background slowing: mild severity

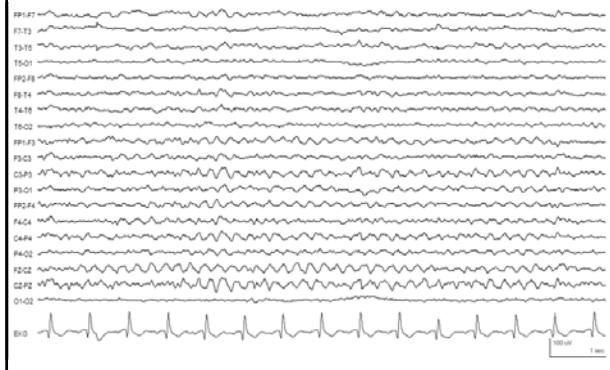

## Slow posterior basic rhythm

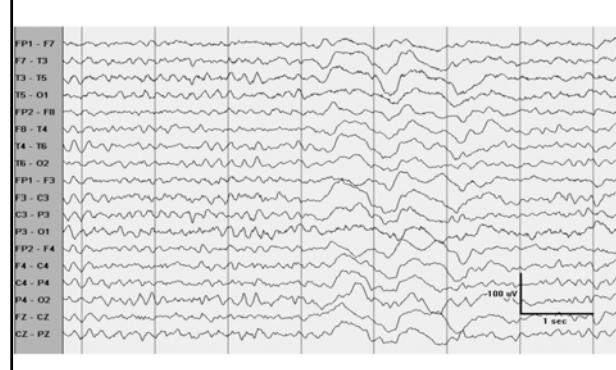

## Intermittent slowing: moderate severity

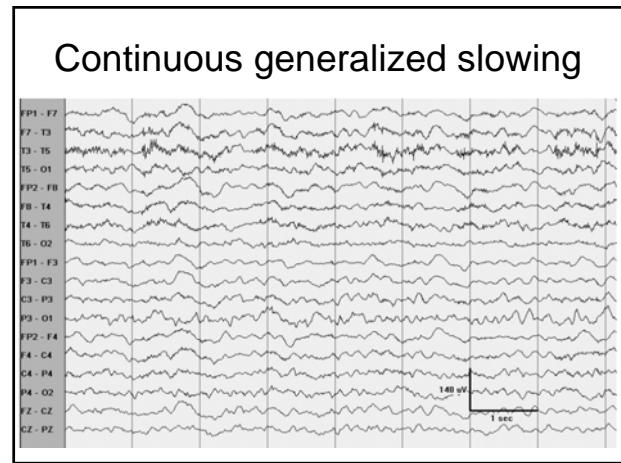

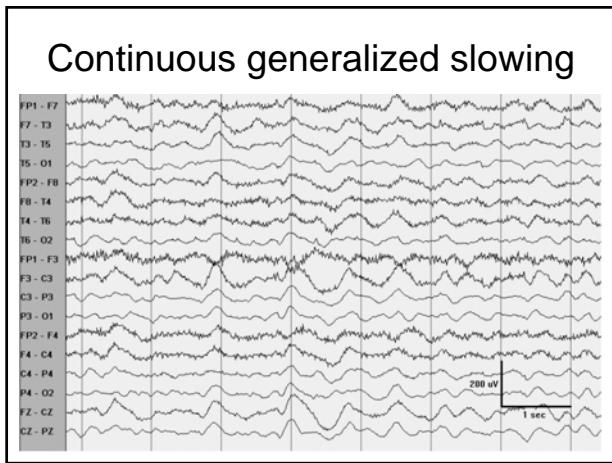

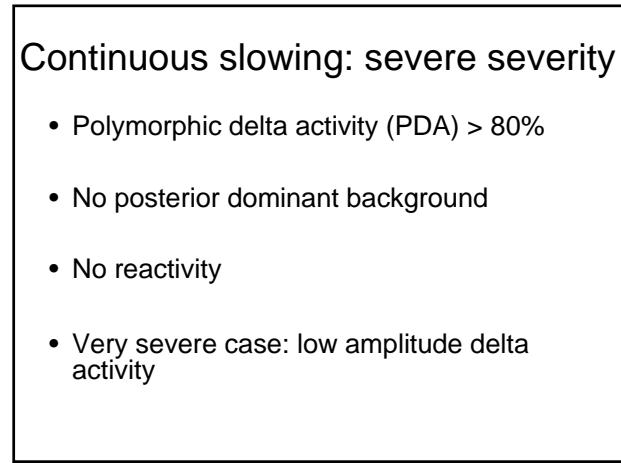

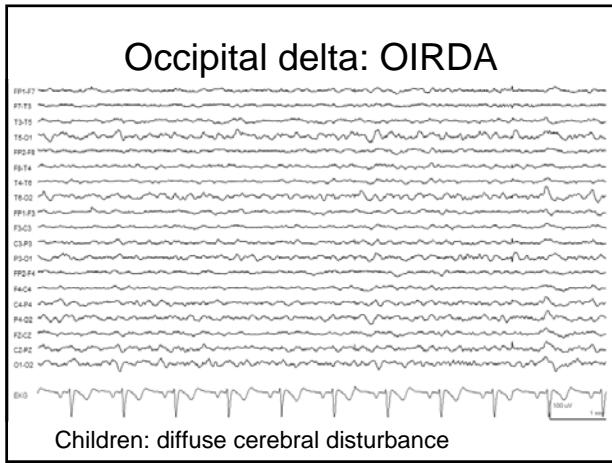

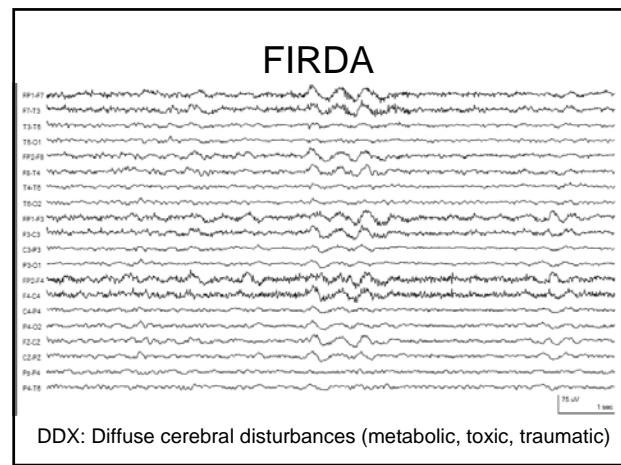

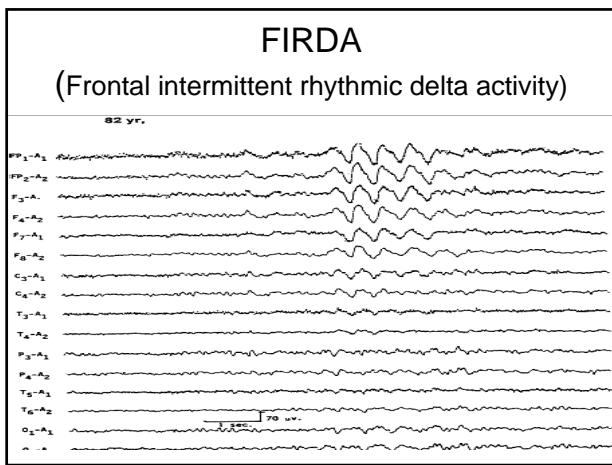

- Posterior dominant background and reactivity
- Burst of high amplitude rhythmic generalized slowing
  - Polymorphic delta
  - Intermittent burst of theta
- FIRDA
  - Frontal intermittent rhythmic delta activity
- OIRDA
  - Occipital intermittent rhythmic delta activity

## Intermittent central theta

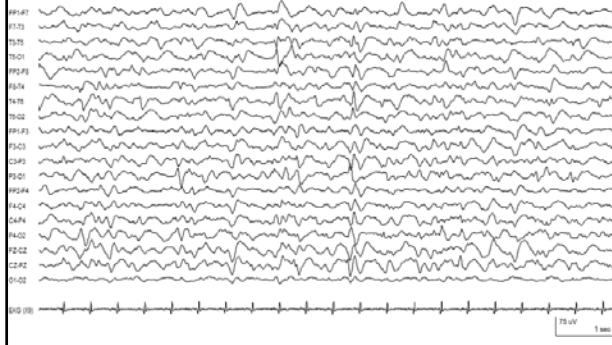

## Burst of generalized slowing

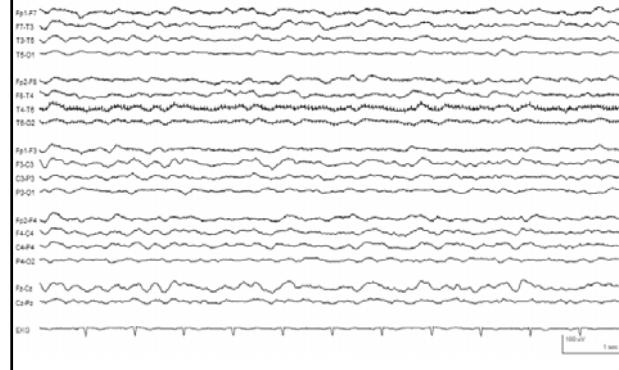

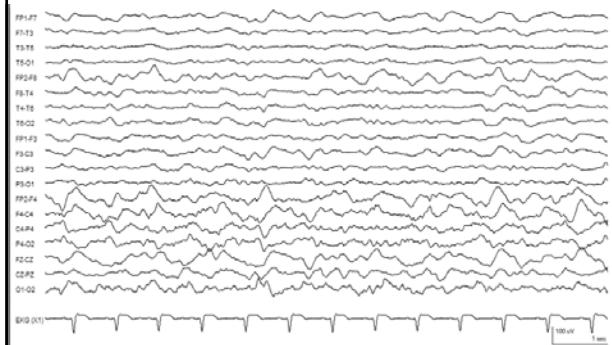

### Severe encephalopathy with epileptic

### Generalized slowing

### Generalized and focal slowing

i.e. brain tumor and increased intracranial pressure

### More severe EEG patterns

- Periodic patterns
- Burst-suppression pattern
- Electrocerebral inactivity

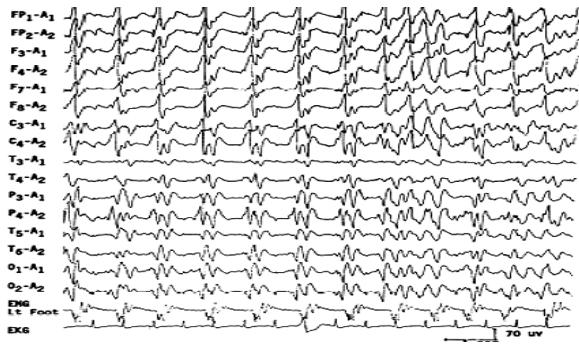

### Periodic patterns

- Periodicity
- Complex / multiphasic (epileptiform-like)
- Bilateral occurrence
  - Bilateral periodic epileptiform discharges
    - (Bi-PEDs)
  - Generalized periodic epileptiform discharges
    - (GPEDs)
  - NOT Bi-PLEDs (*independent*)

### Generalized periodic pattern

### Generalized periodic pattern with myoclonus in anoxic enceph.

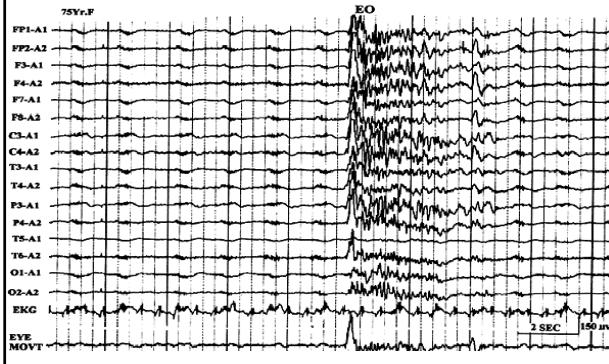

### Burst-suppression pattern

- Periodic pattern
- Burst period
  - Mixture of sharp & slow waves ~ 1-3 seconds
- Suppression period
  - Activity < 10 µvolt ~ 5-10 seconds
- Common pattern of anoxic encephalopathy
  - DDx: drug & hypothermia

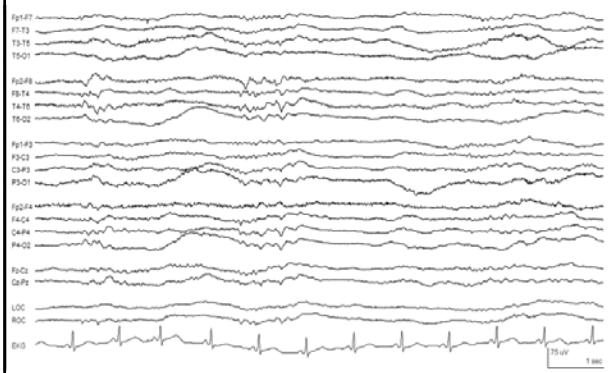

### Burst-suppression pattern

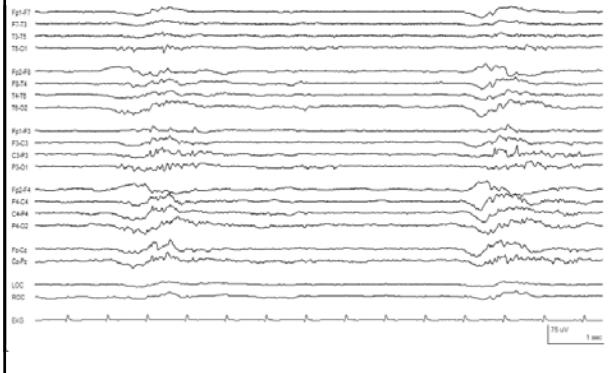

### Burst-suppression pattern

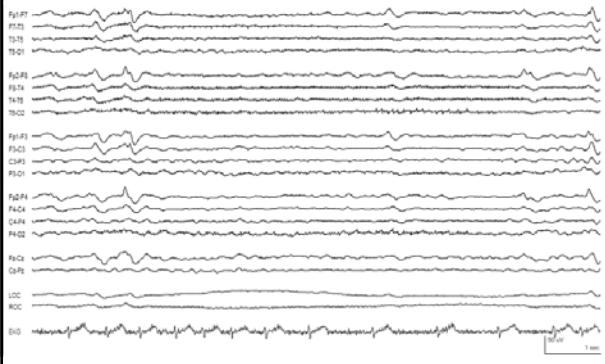

### Burst suppression

### Burst suppression

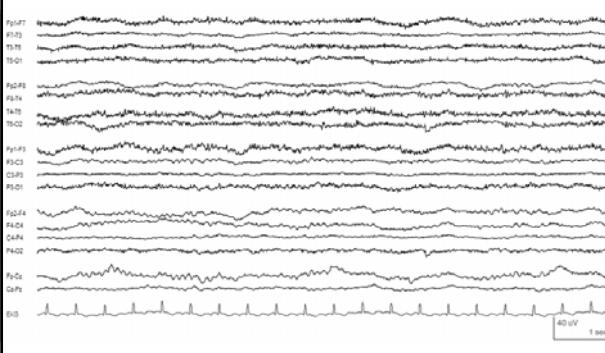

### Burst suppression

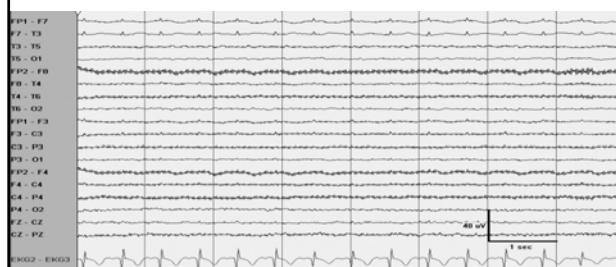

### Background suppression

- A nearly flat EEG
- Amplitude < 10 µV
- No reactivity

### Nearly flat EEG

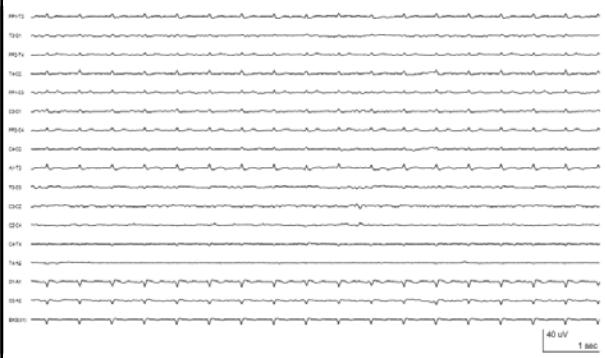

### Electrocerebral inactivity

- Amplitude < 2 µV
- One of brain death confirmation criteria

### Isoelectric

### Less common EEG patterns

- Alpha coma
- Beta coma
- Spindle coma
- Triphasic wave

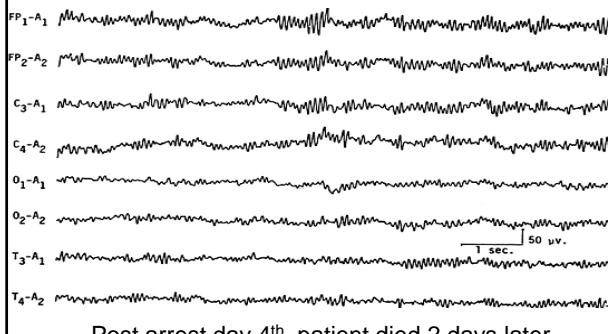

## Alpha, beta and spindle waves

- Normal or abnormal
- In comatose patients
  - Amplitude
  - Widespread or unusual spatial distribution
  - Near continuous
  - Non-reactive
- Impression: very severe diffuse encephalopathy

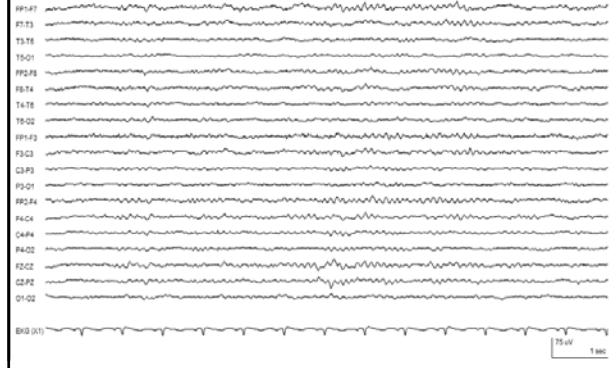

## Alpha coma (anoxia > others)

## Alpha coma

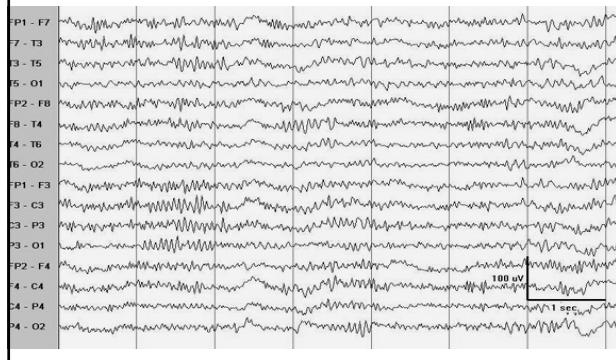

## Alpha coma

## Beta coma (drug > others)

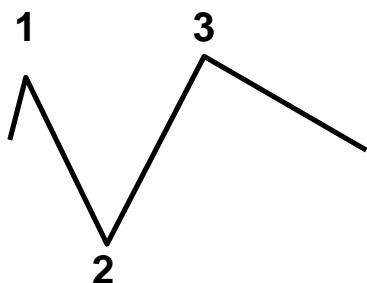

## Spindle coma

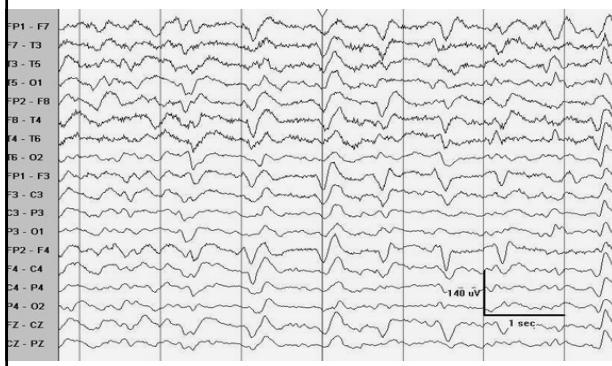

## Triphasic waves

- Amplitude > 70  $\mu$ V (200-300  $\mu$ V)
- Fronto-central predominant
  - Frontally positive sharp transients
- Symmetrical bilaterally synchronous
- Burst of repetitive waves, frequency 1-3 Hz
- Un-reactive
- Anterior-posterior lag
- Not only hepatic encephalopathy
- Adult > children

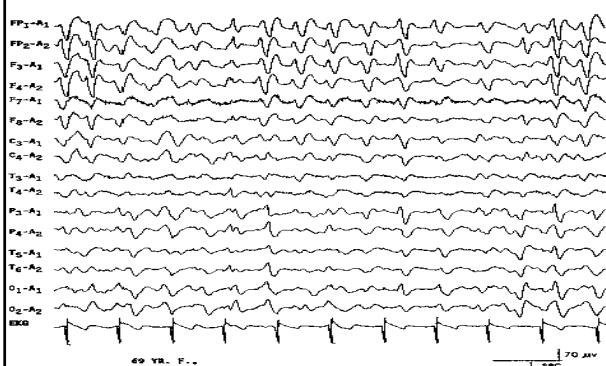

## Why do we call it a “Triphasic wave”?

## Triphasic wave

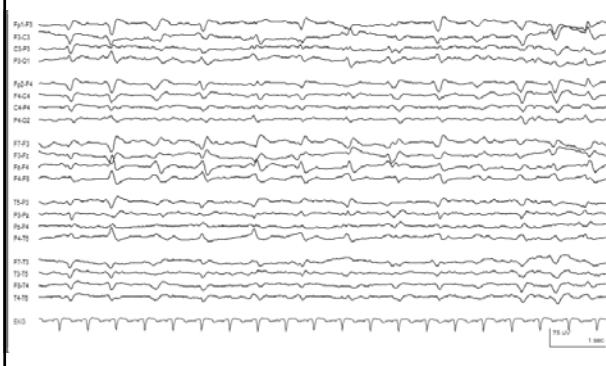

## Triphasic wave

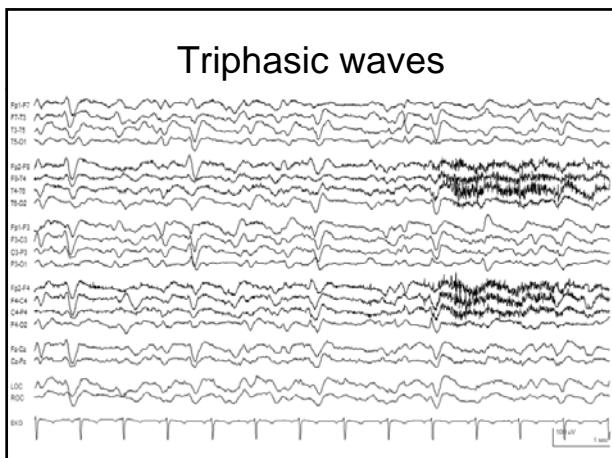

## Triphasic wave

## Triphasic waves

### Severity assessment

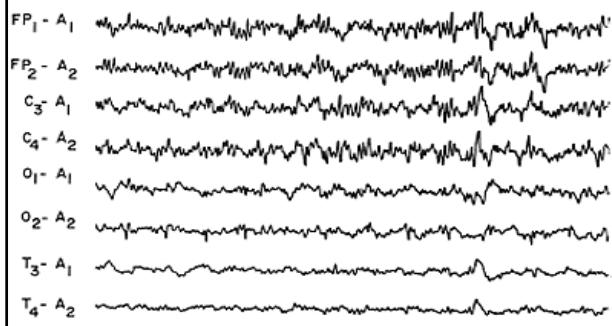

Grade	Characteristics
Grade I	Dominant activity is alpha rhythm with minimal theta activity
Grade II	Dominant theta background with some alpha and delta activities
Grade III	Continuous delta activity predominates, little activity of faster frequencies
Grade IV	Low-amplitude delta activity or suppression-burst pattern
Grade V	Nearly “flat” tracing or electrocerebral inactivity

### EEG in specific encephalopathies

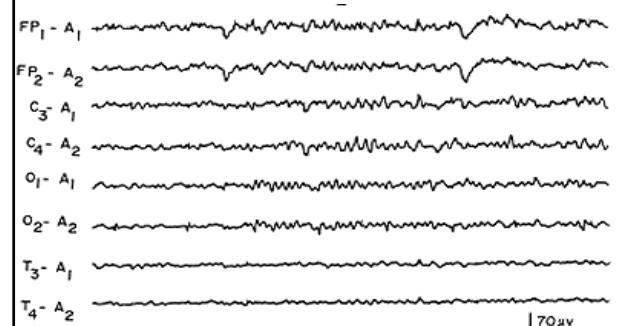

### Toxic encephalopathy

- Sedative-hypnotic agents overdose
- Pathognomonic
  - Excessive beta activity over anterior head regions
  - More severe: generalized theta-delta activity
  - Very severe: Suppression-burst & electro-cerebral inactivity
- Better prognosis than other causes
  - A full neurological recovery

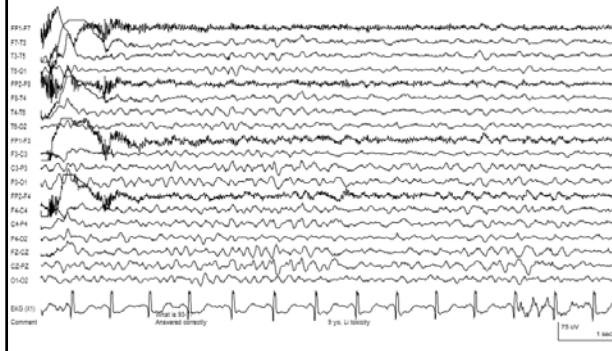

### Phenobarbital intoxication

### 3-day later

### Mild to moderately severe slowing (Lithium intoxication)

### Anoxic encephalopathy

- Evaluate 5-6 hours after cardio-pulmonary arrest
- Severity and prognosis assessment
  - Grade 1: fully recovery
  - Grade 4-5: death or persistent vegetative

### Cerebral death

- More important
  - Clinical assessment: brainstem function
  - Exclude potential reversible factors affecting the brain
- Other assessment tools
  - Blood flow studies
- EEG
  - Amplitude < 2 µV lasting at least 30 minutes
- 2<sup>nd</sup> assessment
  - Adult 6-12 hours later
  - Children 24-48 hours later

### Summary EEG in diffuse encephalopathy

- Diffuse or generalized abnormalities
- The most common = slowing (< 8 Hz)
  - Adult: more frontal (anterior)
  - Children: more occipital (posterior)
- No specific patterns for any etiologies
- Serial EEG
  - Diagnosis: DDX with seizures
  - Prognosis
  - Rx assessment

### EEG in adult patients with Encephalitides & degenerative encephalopathies

### Introduction

- Viral encephalitis
  - Herpes simplex encephalitis
  - Subacute sclerosing panencephalitis
- Creutzfeldt-Jakob disease
- Degenerative encephalopathies
  - White matter disease
  - Cortical gray matter disease
  - Huntington's disease
  - Infratentorial lesion

## Encephalitides & Degenerative encephalopathies

- Common
- Clinical diagnosis > EEG
- Some EEG: ? Pathognomonic

## EEG in viral encephalitis

- Generalized slowing
- Depending on severity
- Non-specific finding

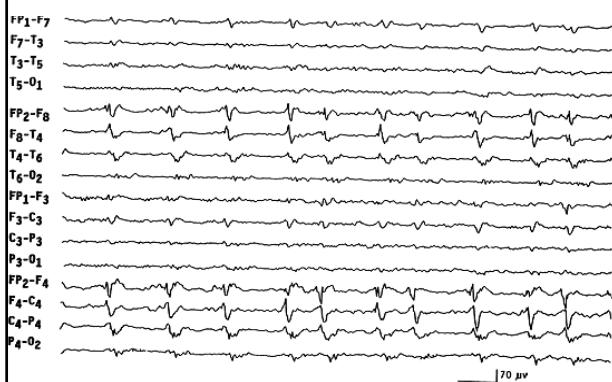

## Herpes simplex encephalitis (HSE)

- A prominent focal abnormality
  - Focal polymorphic delta activity
    - Temporal region > frontal > others
- Pseudo-periodic, focal/unilateral, large amplitude, sharp wave complexes
- Repeat every 1-3 seconds
- Periodic lateralized epileptiform discharges (PLEDs)

## PLEDs in HSE

- Appearing ~ day 2<sup>nd</sup> -15<sup>th</sup> of condition
- Another side affecting
- Synchronous or dependent PLEDs
- Asynchronous or independent PLEDs
- DDX:
  - Acute focal cerebral hemispheric processes
    - Abscess, infarction, neoplasm

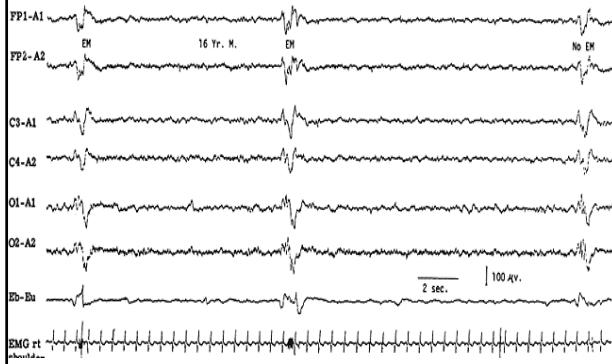

## HSE and PLEDs over Rt temporal region

## Subacute sclerosis panencephalitis (SSPE)

- Pediatrics
- Measles
- EEG:
  - Initial EEG
    - Abnormal during sleep
    - Asymmetry discharge with contralateral myoclonic jerks
  - Late EEG
    - Bilateral synchronous & symmetrical high-amplitude periodic complexes
    - Repeat every 4-10 seconds with myoclonic jerks

## EEG in SSPE

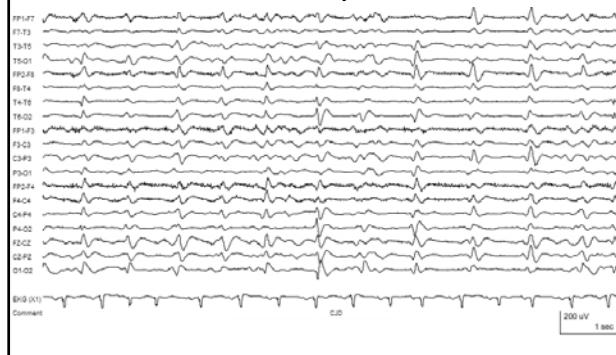

## Creutzfeldt-Jakob disease (CJD)

- Transmittable disease from Prion protein
- Spongiform encephalopathy
- Clinical
  - Rapidly progressive dementia
  - myoclonus

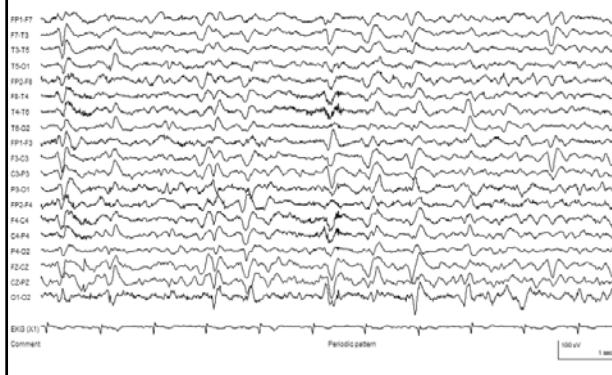

## Creutzfeldt-Jakob disease (CJD)

- EEG
  - Early or intermediate disease (first 3 months)
    - Periodic, bilaterally synchronous wave forms
    - Diphasic or triphasic sharp waves
    - Repeat regularly ~1Hz with myoclonic jerks
  - Late disease
    - Bilateral symmetrical & synchronous periodic discharges superimposed on a flat background

## Periodic patterns: periodic sharp wave complexes

## Periodic slow waves in CJD

## Degenerative encephalopathies

- Lesions
  - Cortical white matter
  - Cortical gray matter
  - Infratentorial lesion

## Cortical white matter diseases

- Leukoencephalopathies
- EEG
  - Abnormal background
  - High-amplitude continuous generalized polymorphic delta activity

## Cortical gray matter

- EEG:
  - Normal, or disorganized background
  - Slow, irregular and low in amplitude abnormal
- Alzheimer's & Pick's disease
  - Non-specific findings
    - Minimal continuous generalized polymorphic delta activity
  - Severe case: sharp or triphasic waves over posterior head region, not persistent

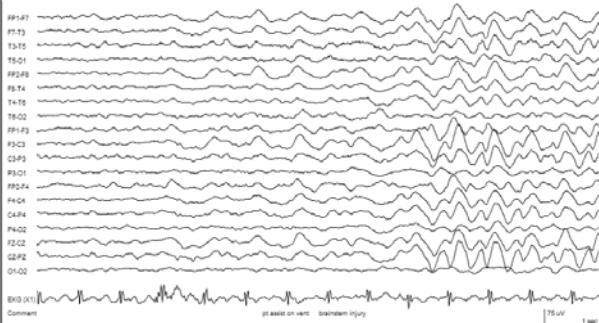

## Huntington's disease

- Clinical diagnosis and genetic test
- EEG
  - A flat tracing absence of any EEG activity in excess of 10  $\mu$ V (even hyperventilation)
  - No rhythmic activity

## Infratentorial lesion

- Examples
  - Spinocerebellar degeneration
  - Parkinson's disease
  - Progressive supranuclear palsy
- EEG
  - Normal
  - Non-specific slowing of background activity

## Polymorphic slowing

## Summary EEG in Encephalitides & Degenerative encephalopathies

- General concepts
  - Common
  - Clinical diagnosis > EEG
  - Some EEG: ? Pathognomonic
    - CJD
    - SSPE
  - Serial EEG
