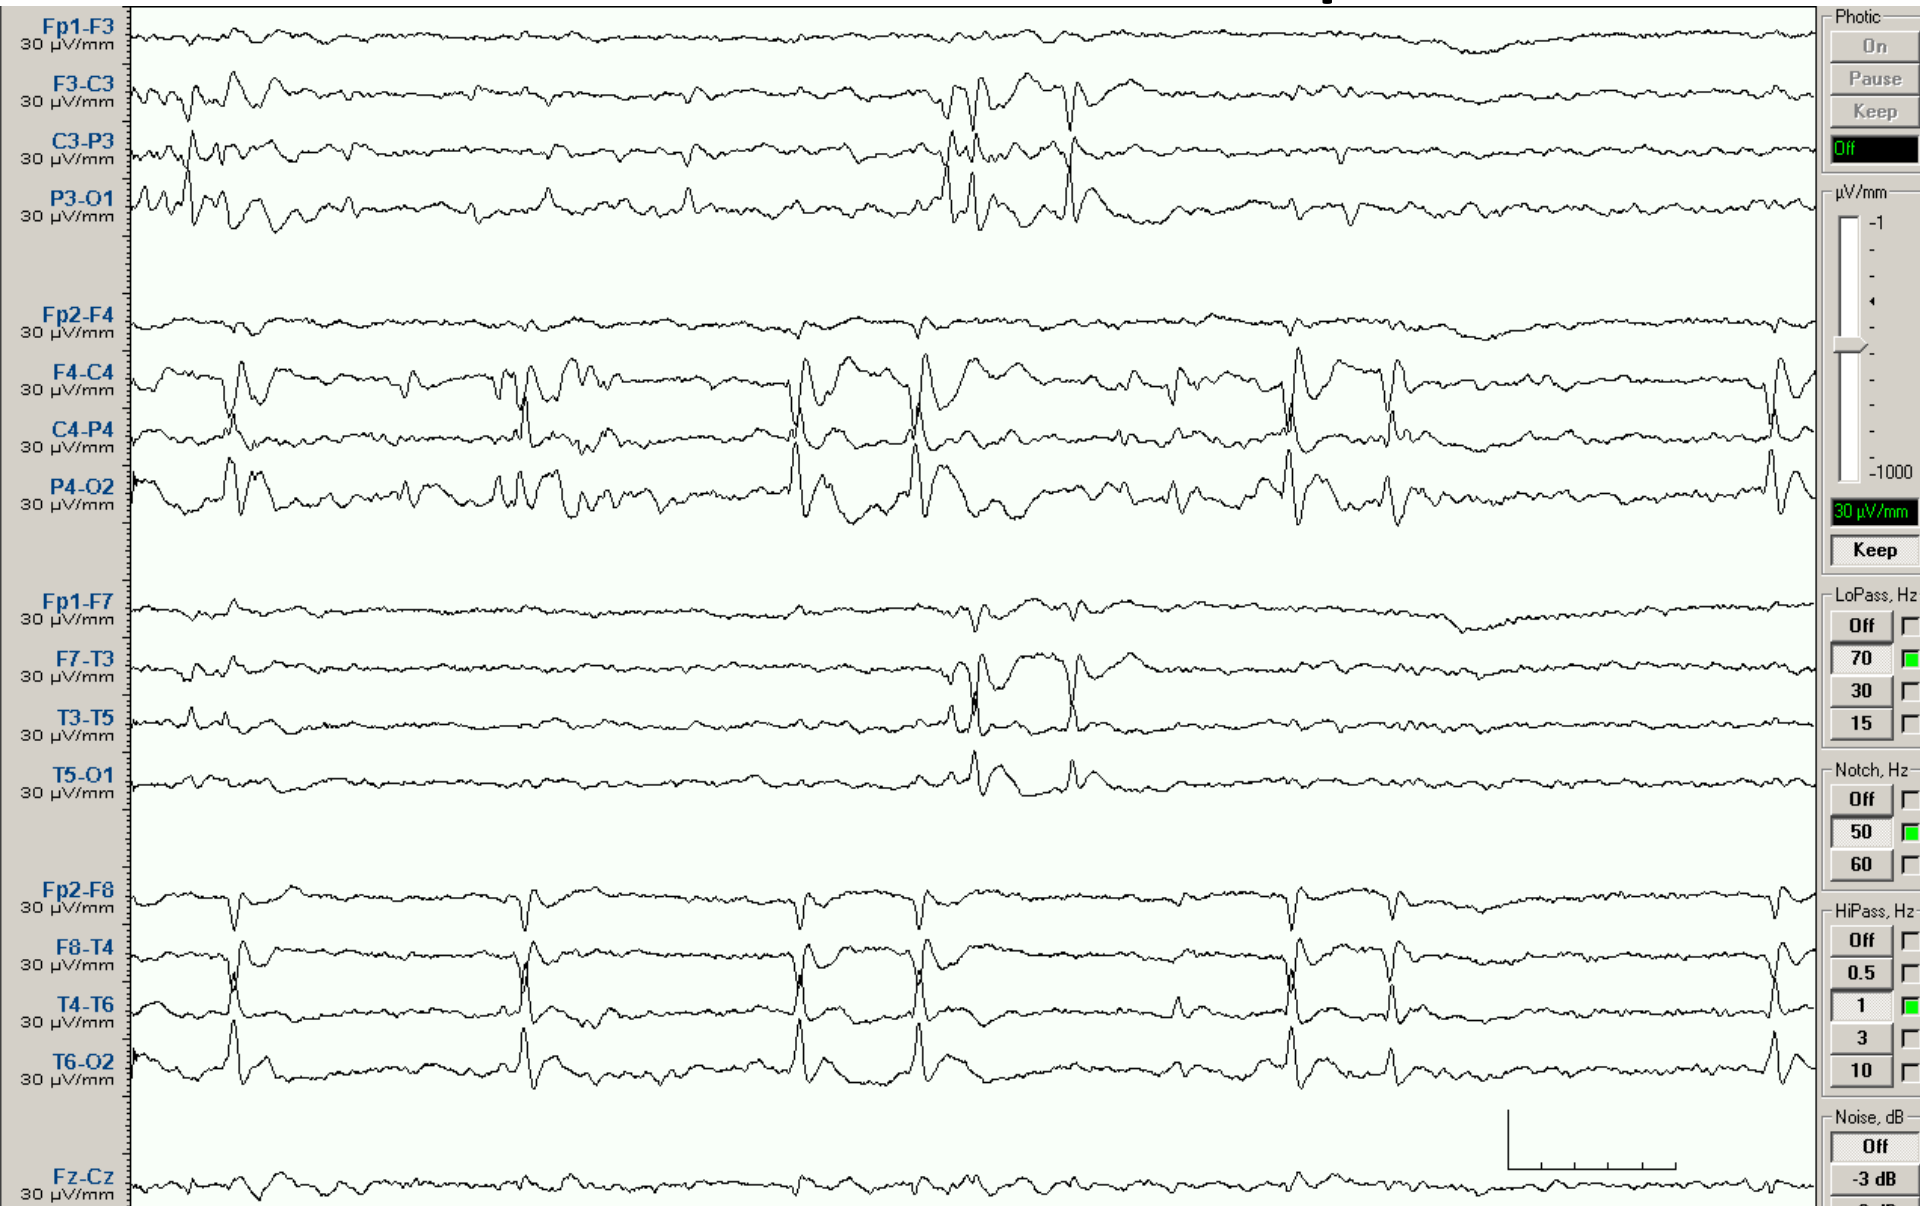
BECTS

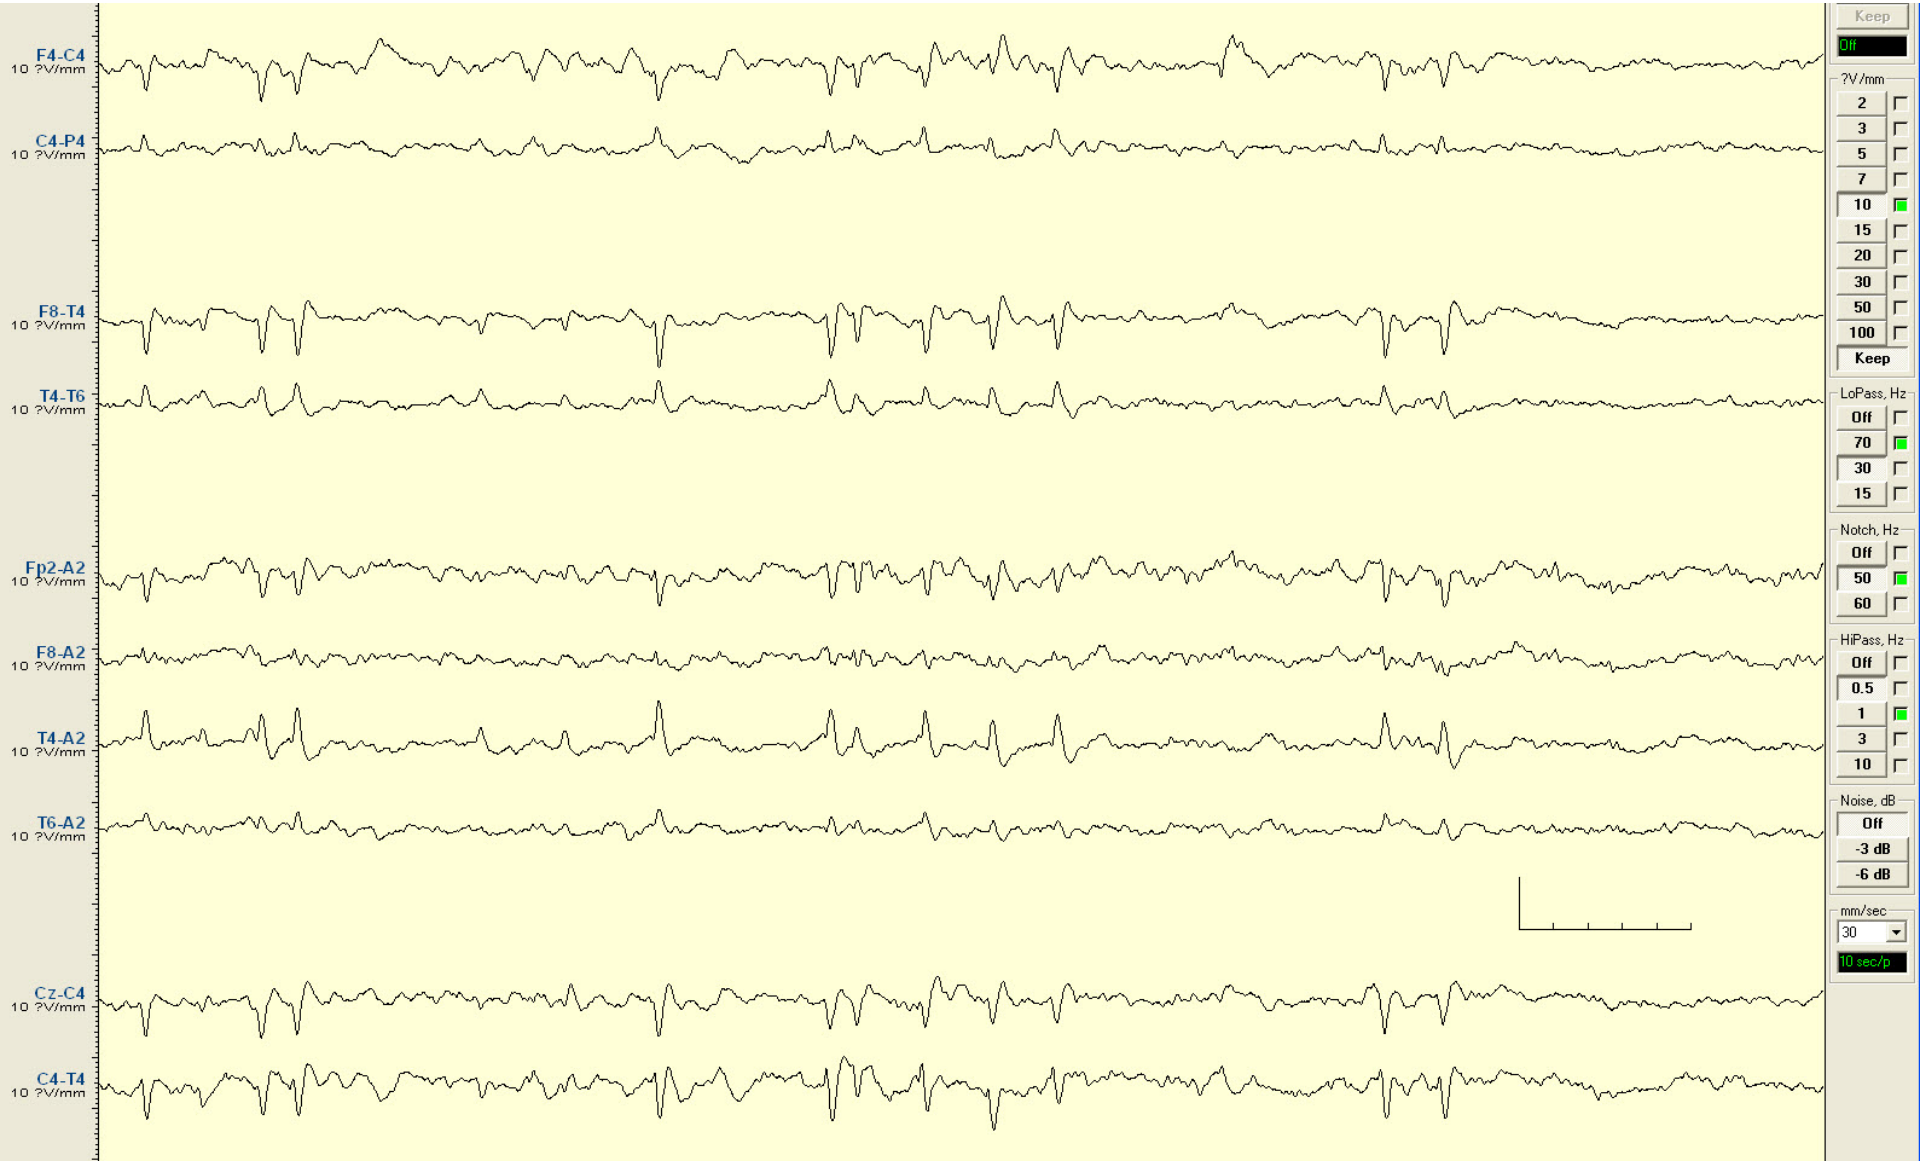
- Onset : 3-14 years (Peak 5-8)
- Seizure type : hemiface (motor and sensory)
  : secondarily during sleep
- Interictal EEG : Diphasic slow spikes
- Ictal EEG :
- Causes : Genetics?
- Course : Benign
- Treatment : May not need if infrequent

Unilateral centro-temporal

Bilateral centro-temporal



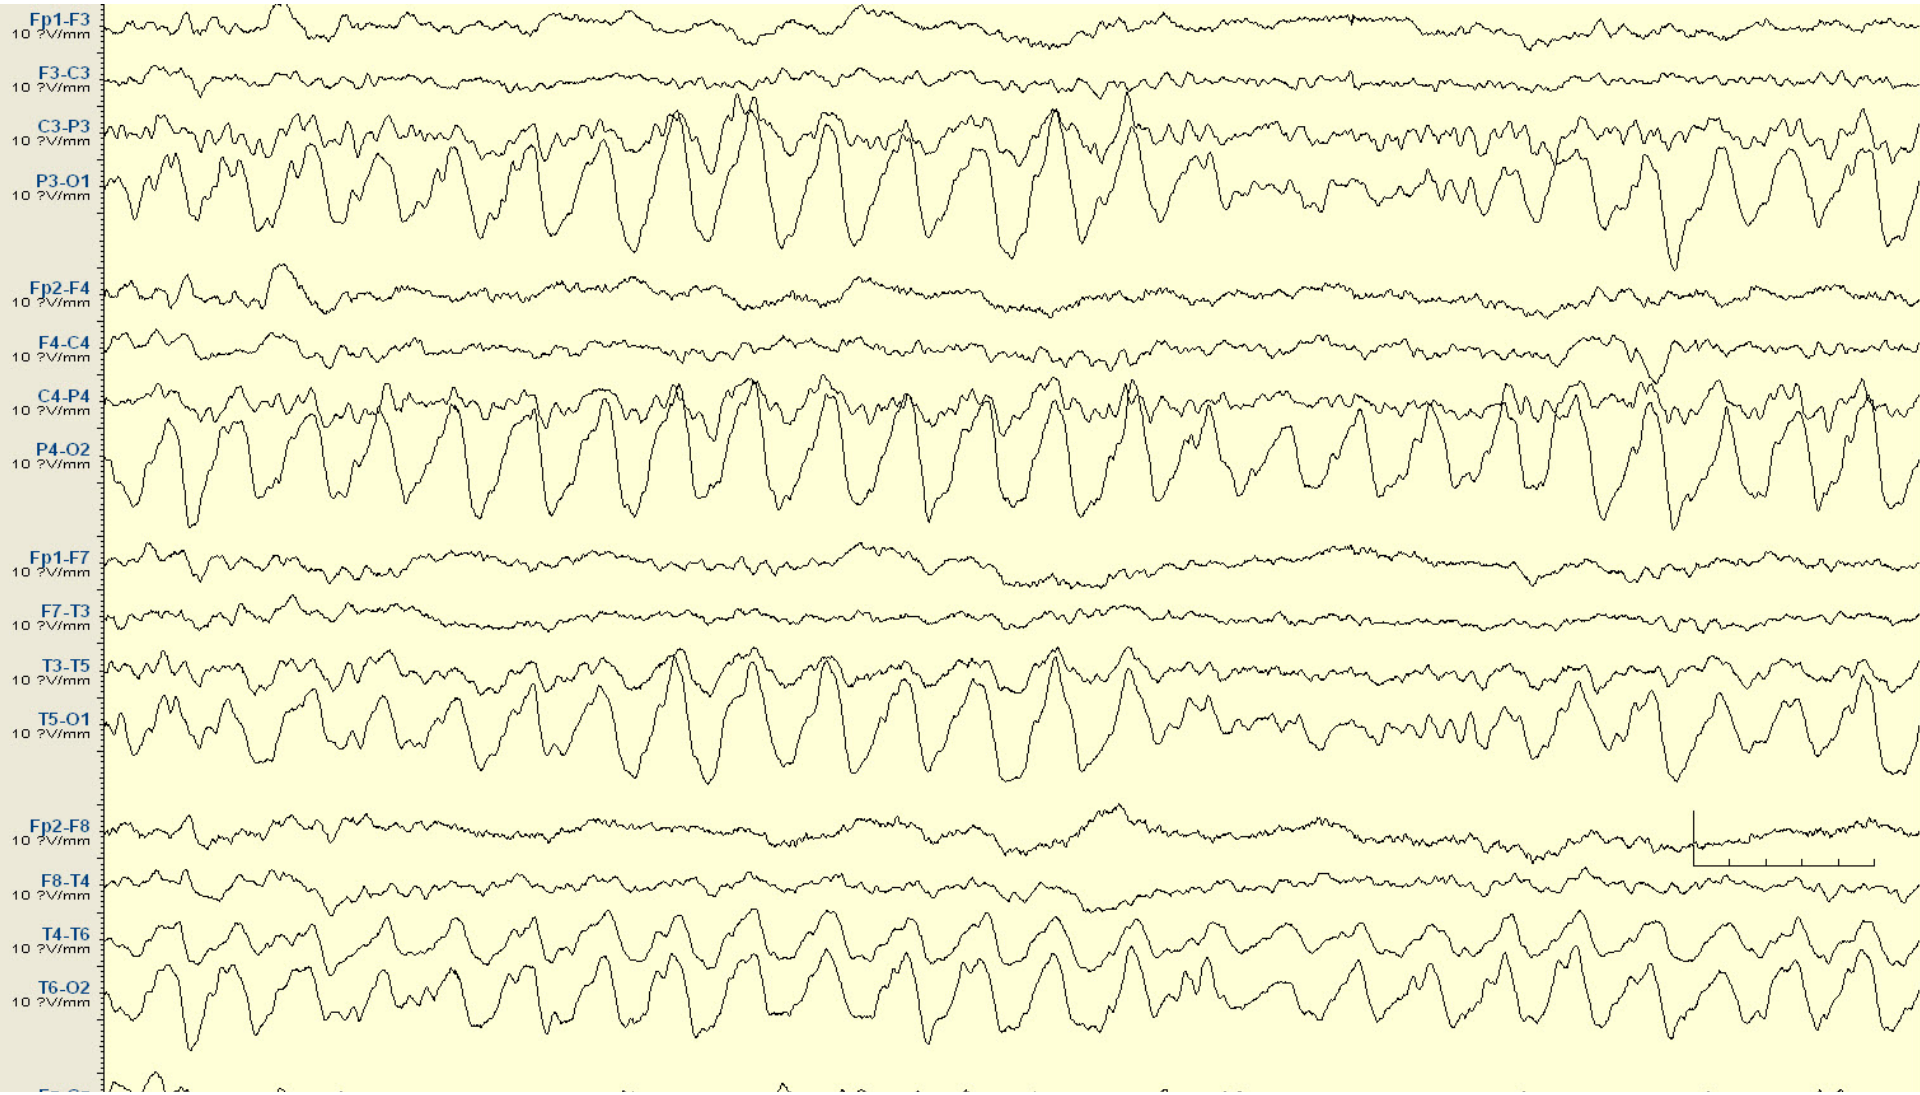
Tangential dipole on reference



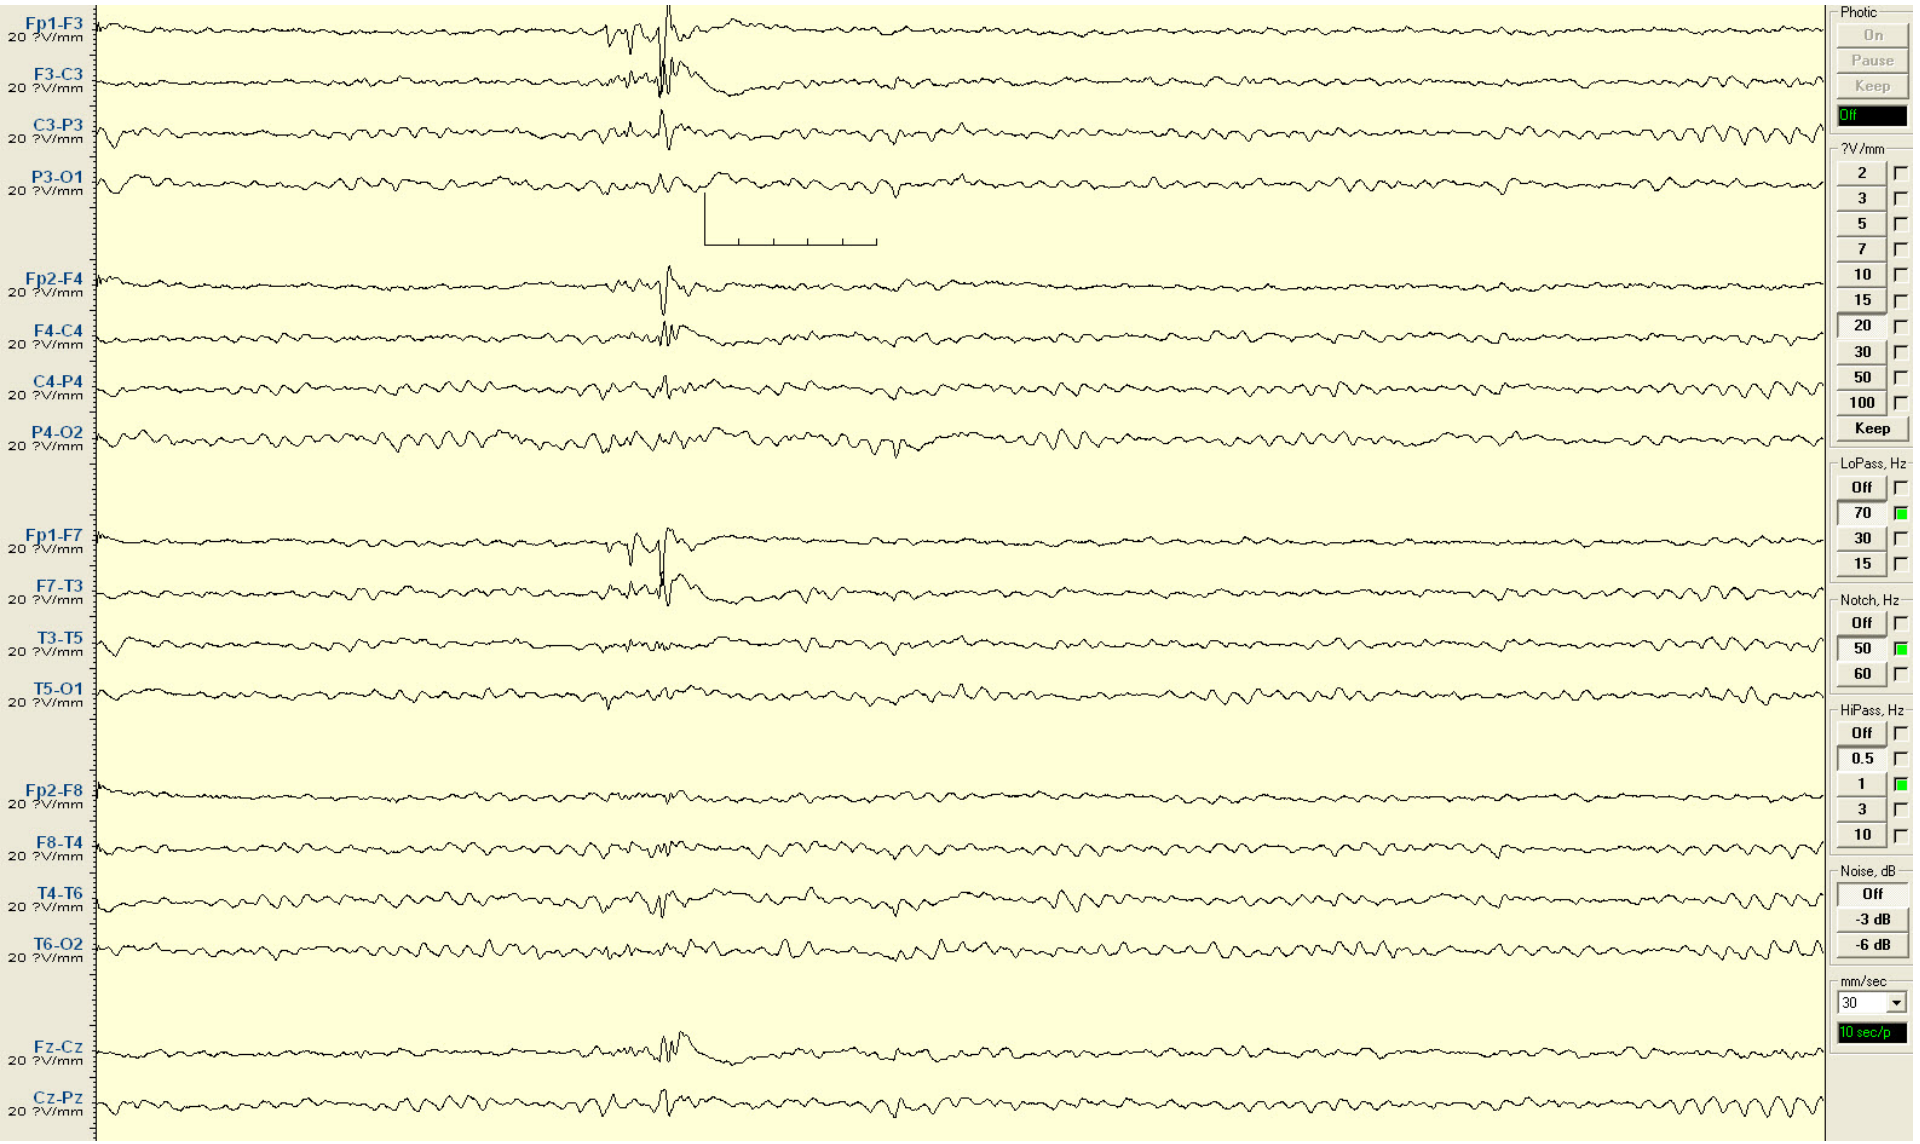
Childhood absence

- Onset : Peak 6-7 years
- Seizure type : Absence
- Interictal EEG : Normal Background,
- Ictal EEG : 3-Hz spike-wave complex
- Causes : Genetics?
- Course : Benign
- Treatment : VPA, LTG, TPM, LEV

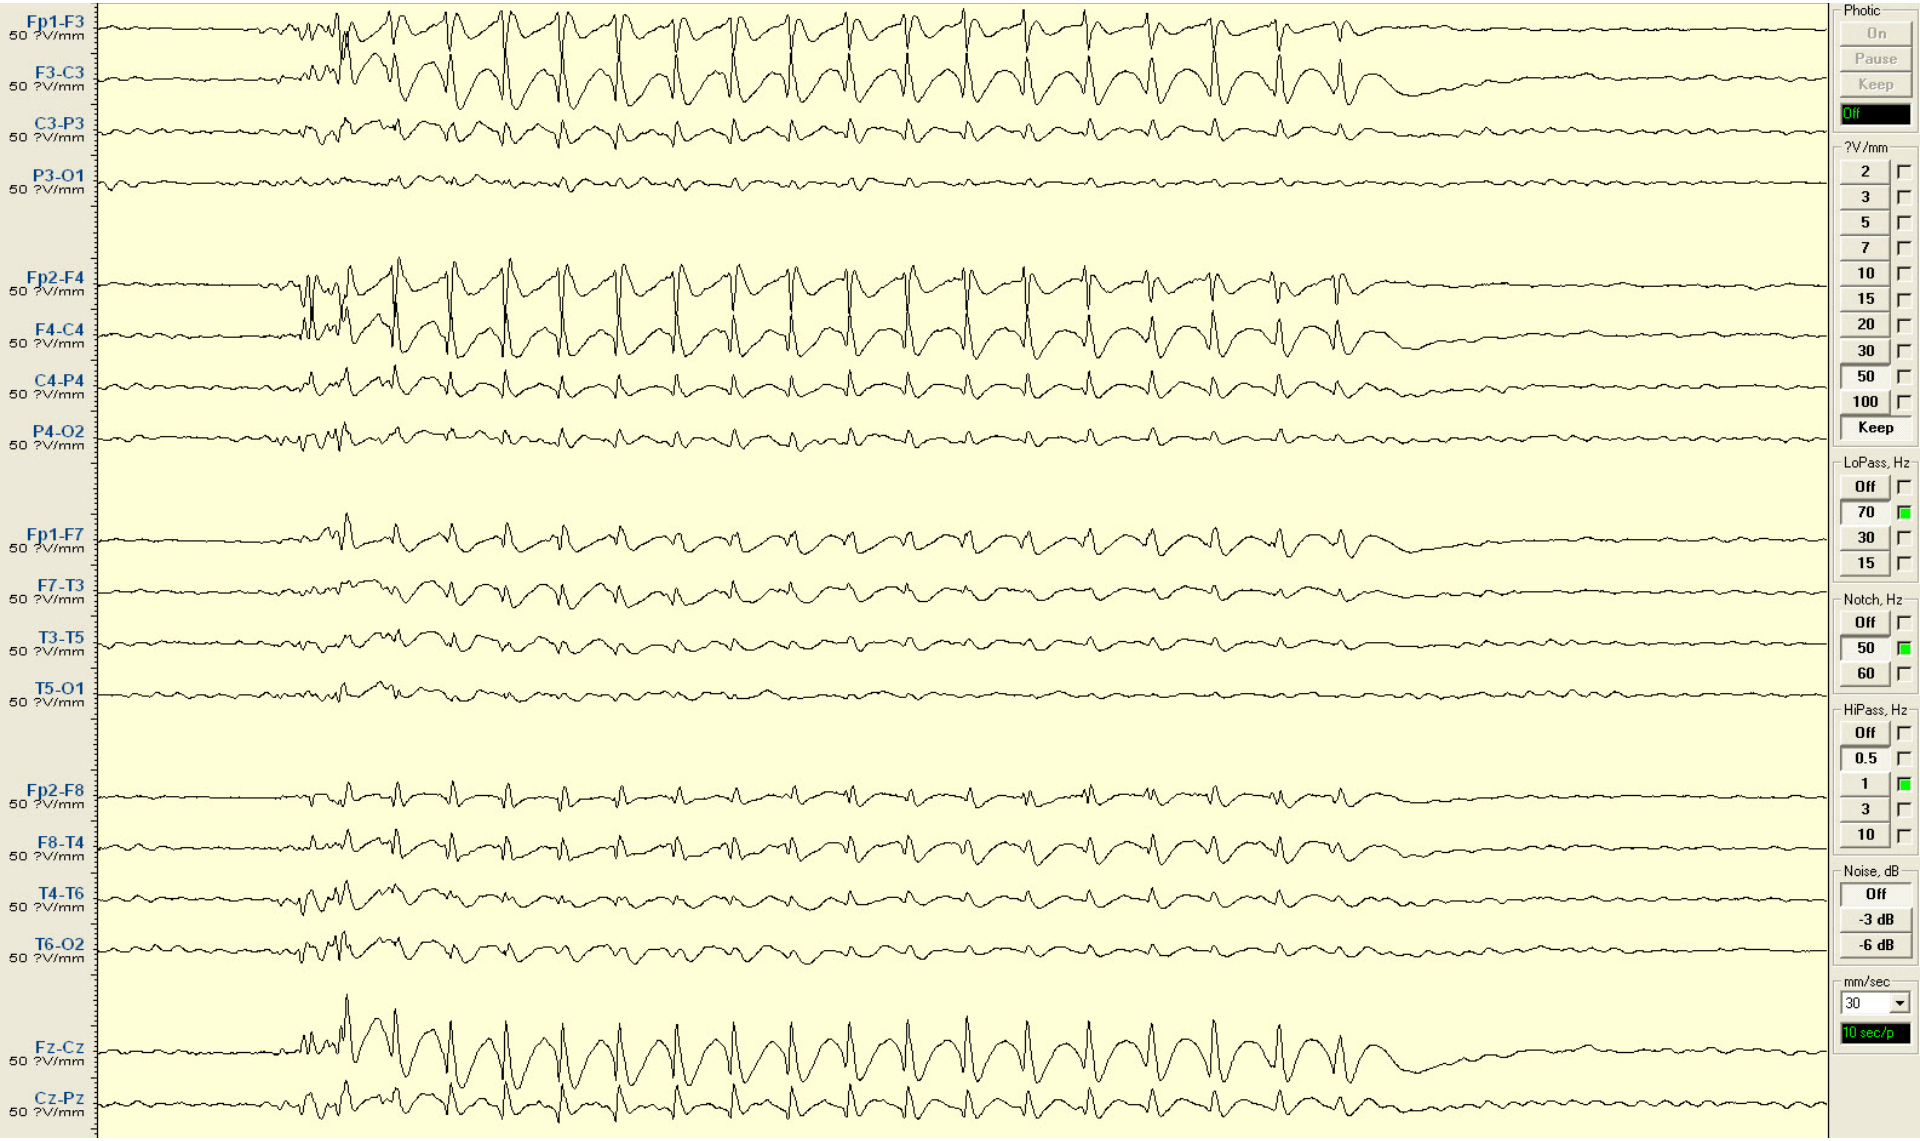
OIRDA during awake



Fragmented PSW during sleep



Typical attack



Landau-Kleffner (Acquired epileptic aphasia)

- Onset : 2-8 years (Peak 5-7)
- Seizure type : Auditory agnosia
  : Nocturnal seizure (Gen, focal)
- Interictal EEG : Awake: Normal
  : Sleep: Repetitive spike-wave, more over the temporal
- Ictal EEG :
- Causes : Immune process?
- Course : Variable
- Treatment : AED + corticosteroid, IVIG

Central-temporal spike

ESES or CSWS

- Onset : Peak 4-5 years
- Seizure type : neuropsychological/motor impairment as a major features
  : Epilepsy (focal, generalized)
- Interictal EEG : Awake: normal
  : Sleep: continuous diffuse spike-wave complex
- Causes : Immune?
- Course : Variable, generally poor
- Treatment : AED + steroid/ IVIG/ Sx

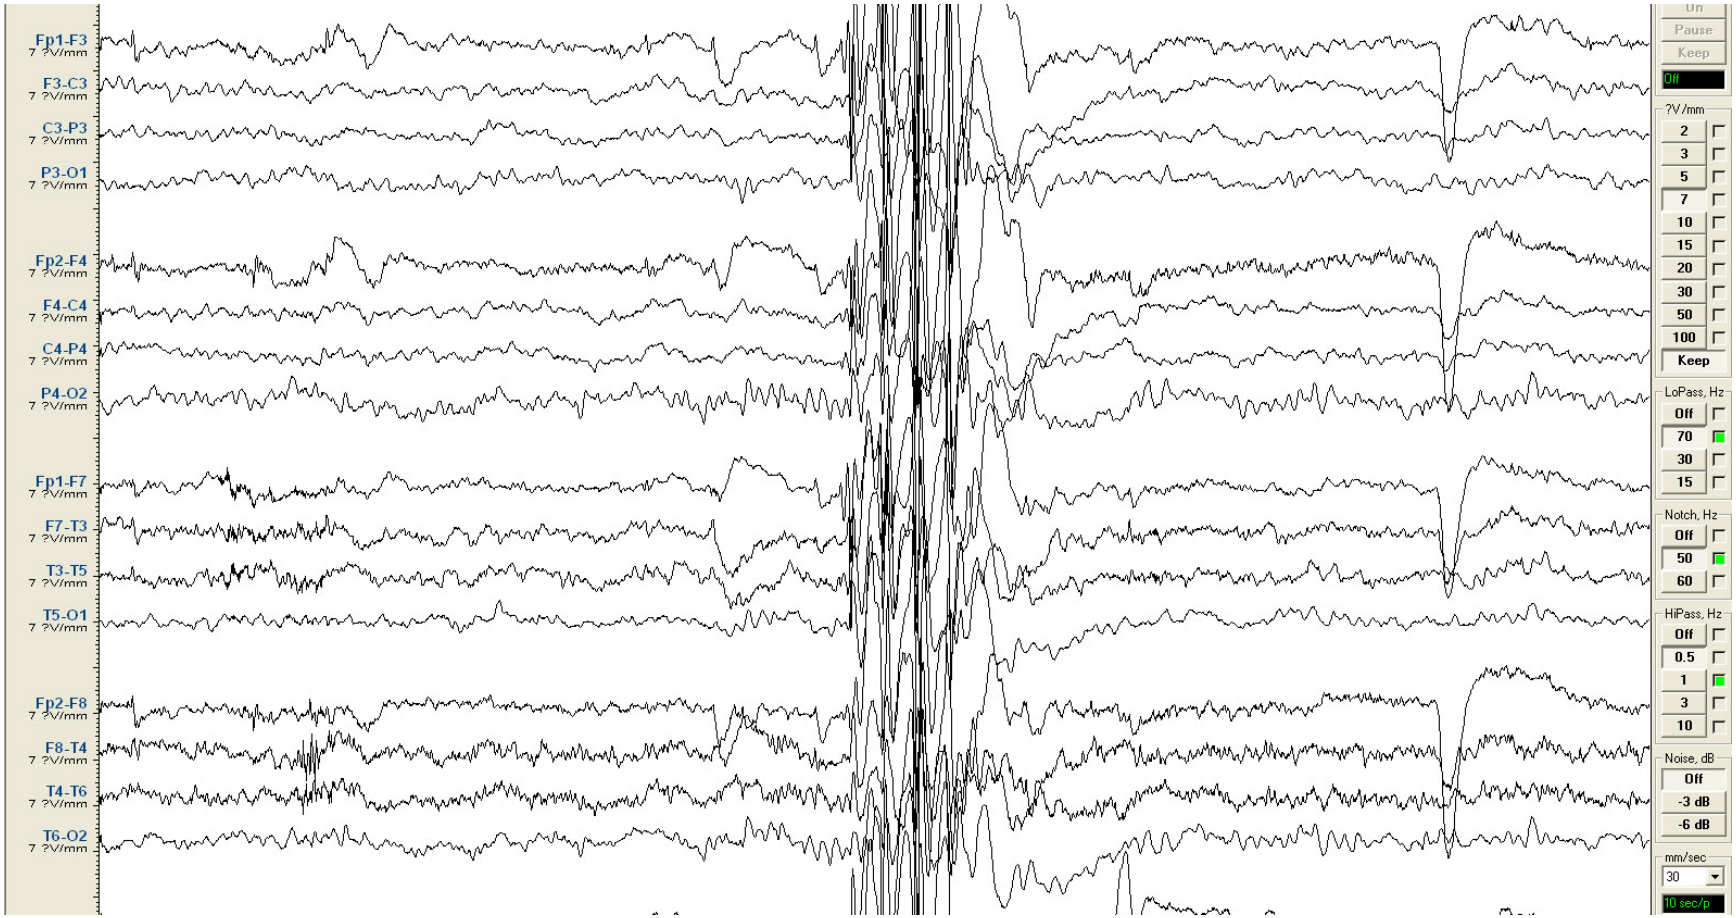
Fragmented during sleep

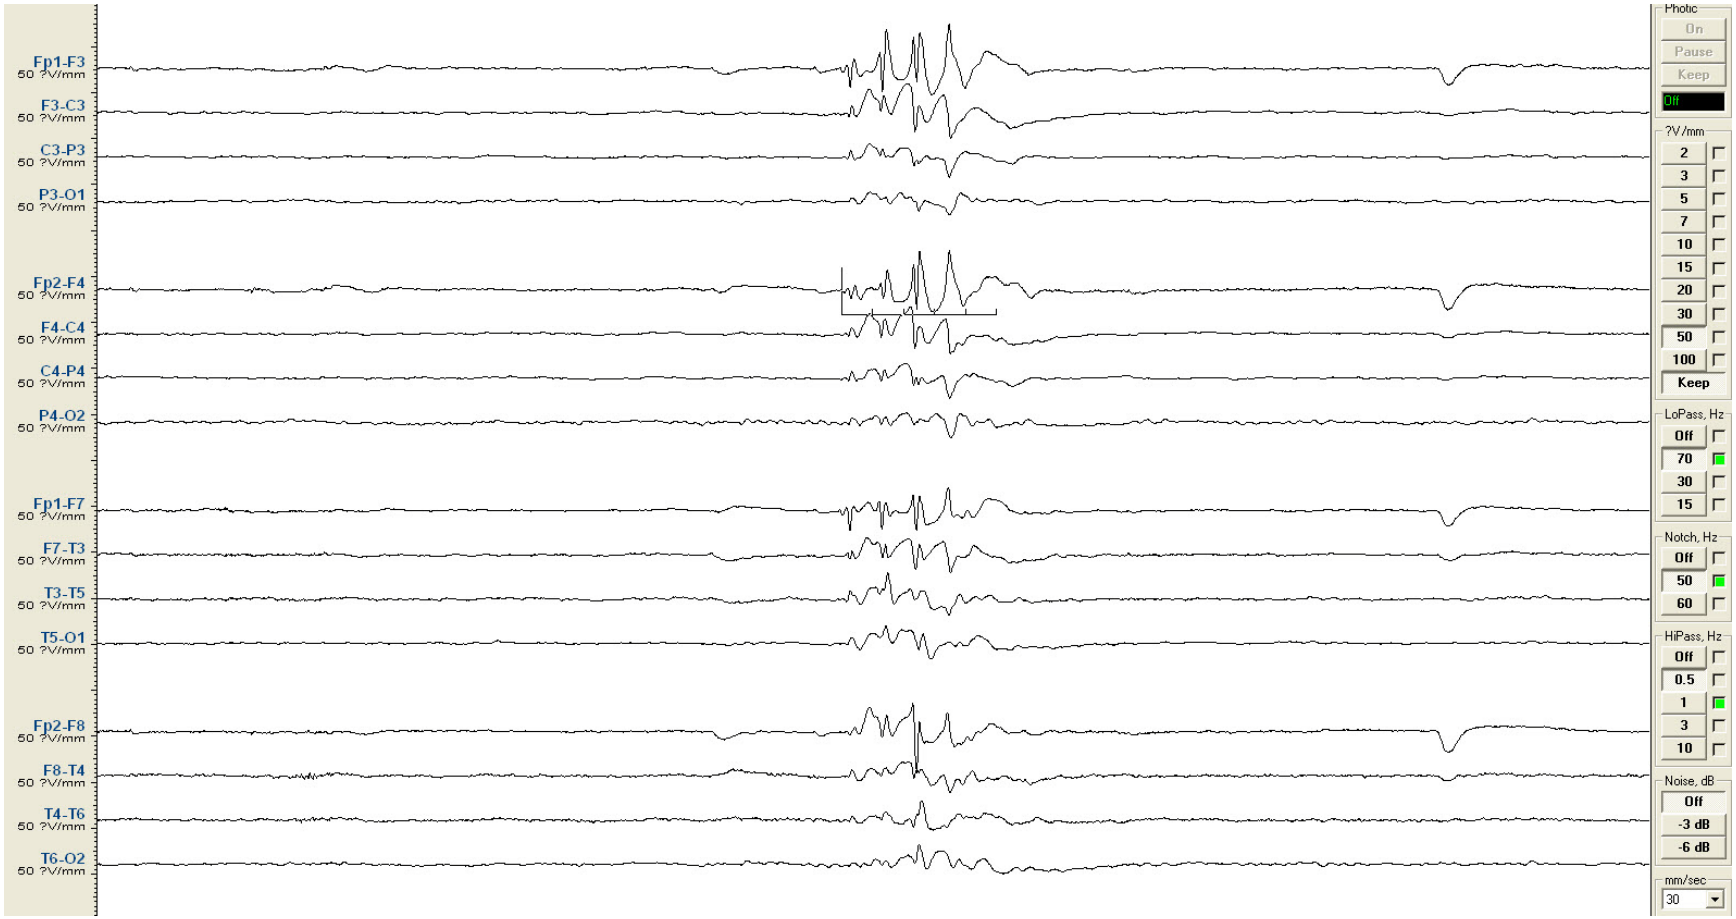
Juvenile myoclonic epilepsy (JME)

- Onset : 12-18 years
- Seizure type : Myoclonic (am, upper limbs)
  : GTC (80-90%)
  : Absence
- Interictal EEG : Polyspike-wave (4-6 Hz)
- Ictal EEG :
- Causes : Genetics?
- Course : Life-long treatment
- Treatment : VPA, TPM, LEV, LTG

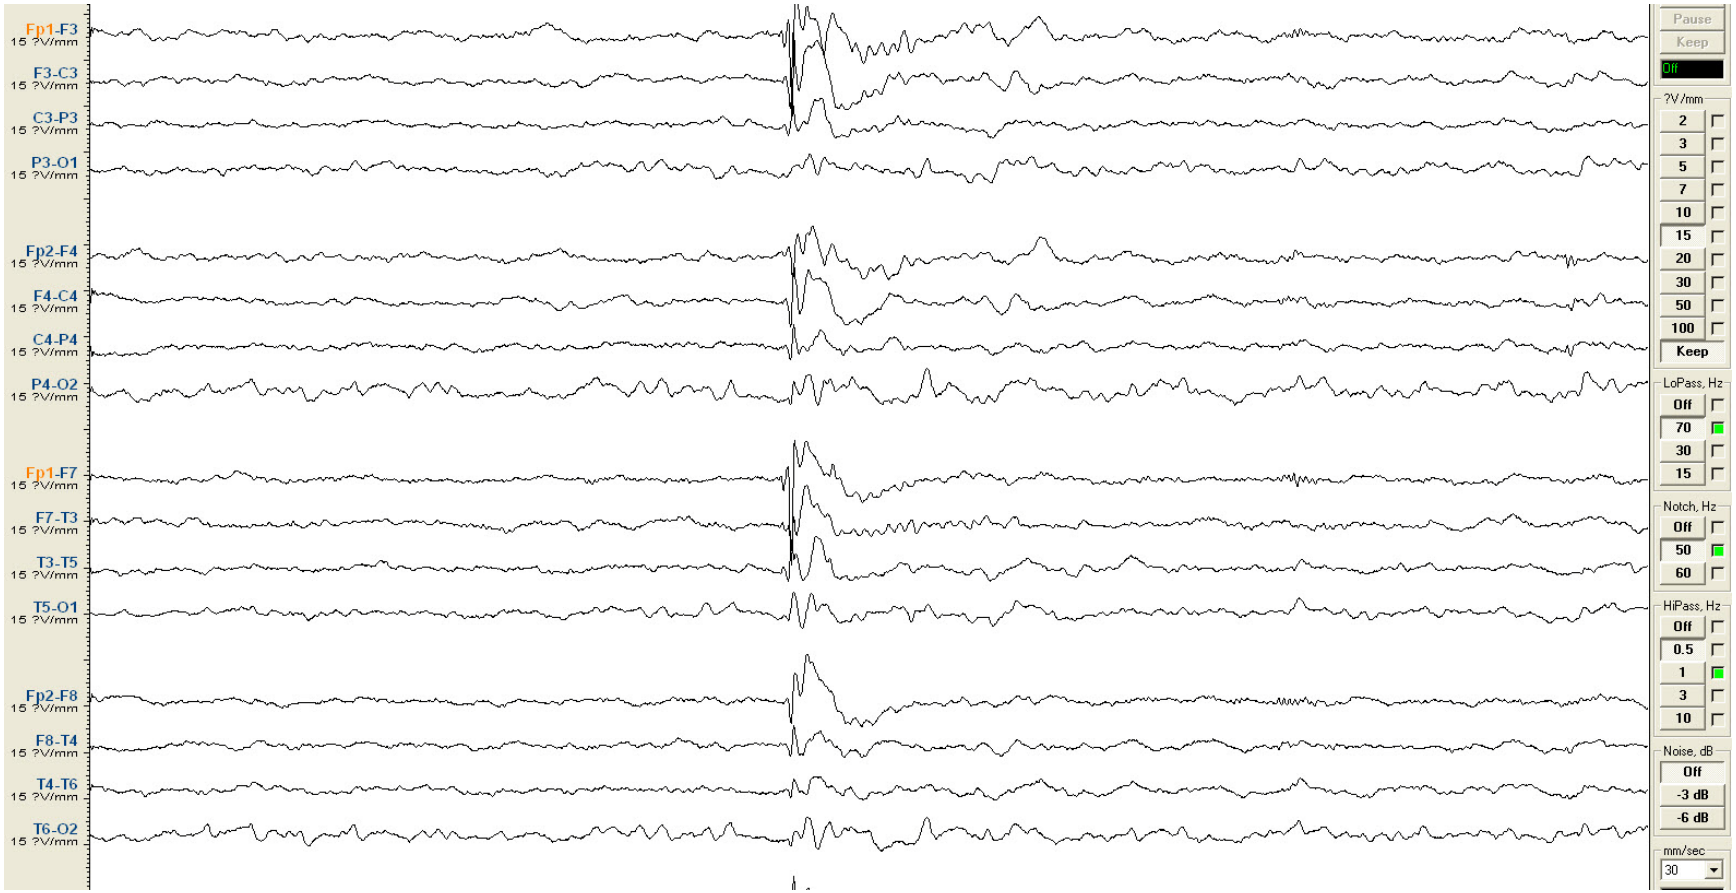
Fast spike-wave at 7 microvolt/cm



Same EEG at 50 microvolts/cm



Fragmented PSW without clinical



Practical points

- EEG during awake and asleep in each epileptic syndrome may have different characteristics
  - BCECT: may be only abnormal during sleep
  - IS: hypsarrhythmia (awake), burst-suppress (sleep)
- Both awake and asleep EEG, as well as certain activation methods should be done in individual patients with different syndrome
  - Absence: hyperventilation
  - JME: sleep deprivation and awaken during EEG

Practical point

- Physicians who order the EEG should give adequate information regarding the clinical seizures and other information in order to increase the yield of diagnosis
  - Absence : should stress on hyperventilation
  - BRE : should include sleep portion
  - BEOP : should include eye open, eye closing
  - JME : should include EEG after awakening
  - LKS, ESES : definitely should include slow wave sleep portion

Summary

- EEG is an important role in epileptic syndrome diagnosis
- However, accurate EEG interpretation must have important clues from clinical history provided by attending physicians
- EEGers need information provided by attending physicians and vice versa

Summary

- Accurate epileptic syndrome diagnosis leads to appropriate management of each patients as well as counseling.
